Education

B.Sc. in Electrical and Electronic Engineering

Islamic University of Technology (IUT), Gazipur, Bangladesh

Jan 2020 – Jun 2024

CGPA: 3.87 / 4.00

Thesis — Developed an open-source simulation framework for autonomous vehicles using camera-based lane detection, evaluated predictive and classical control strategies for path tracking (MPC, PID). Published and presented.

Professional Experience

Research and Development Engineer — Cybernetics Hi-Tech Solutions Pvt. Ltd., Dhaka

Oct 2024 – Present

- Co-lead the development of robotic and embedded systems from initial requirements through to delivery, covering hardware, software, and operator interfaces, for defence, industrial-automation, and unmanned-systems clients.
- Design and implement autonomous navigation stack for ground vehicles, including positioning, route planning, motion control, and the coordination of multi-vehicle fleets.
- Develop real-time embedded system for distributed motor control and sensor systems across a range of industrial communication standards.
- Design custom control electronics from schematic through fabrication, testing, and commissioning for demanding field environments.

Part-Time Lecturer — Ahsanullah University of Science and Technology, Dhaka

Jul 2025 – Jun 2026

- Conducted C++ Programming and Digital Signal Processing laboratories across two consecutive semesters, covering four sections in total.
- Delivered lectures, prepared laboratory manuals, and conducted student assessment.

Projects

Man-Transportable EOD Robot (Jontro Soinik 2.0)

- One of the principal developers of an explosive ordnance disposal vehicle with a seven-degree-of-freedom manipulator.
- Co-developed the motion-control software governing eleven servo drives distributed over two independent CAN buses, implementing the CANopen (CiA-402) standard so that each joint can be commanded by position, speed, or torque.
- Contributed to a closed-form solution to the arm's inverse kinematics. Verified against the robot's geometric model and integrated with MoveIt 2 for collision checking.
- Wrote the STM32 firmware carrying the operator's control signal over an Ethernet link via optical fiber.
- Developed the Android operator console (app), presenting five simultaneous low-latency video feeds, a live telemetry dashboard, and a three-dimensional on-screen model mirroring the robot's actual posture.

Autonomous Guided Vehicle — CYBERFLEET

- Designed and delivered the complete ROS 2 autonomy software for a three-vehicle warehouse robot fleet, covering how each vehicle establishes its position, plans a route, follows it, and coordinates with the others.
- Co-developed an extended Kalman filter combining continuous wheel-encoder motion with intermittent camera sightings of fixed floor markers.
- Built the marker-based localisation front end: camera calibration, pose estimation from each observed marker.
- Contributed to the route planning that treats time as a planning dimension, preventing both collisions and deadlocks.
- Added LiDAR-based obstacle detection.

Autonomous Target-Tracking Drone

- Implemented live onboard target tracking, running object-detection models directly on a Pi 5 both with an AI accelerator.
- Created the aerial training dataset and tested different tracking methods.

Toll-Booth Automation

- Developed the lane-controller firmware on an STM32 microcontroller, structured as a table-driven state machine.
- Integrated inductive loop coils, an infrared exit sensor, and licence-plate recognition to detect vehicles.
- Designed three custom circuit boards with optical isolation, surge and reverse-polarity protection.

Jontro Soinik 1.0 and Smart Soinik 1.0

- Contributed to an addressable serial-bus architecture in which every control node carries its own address.
- Contributed to sensor integration and to power system design through to circuit-board fabrication.

Offline Hardware Cryptocurrency Wallet

- Developed a fully crypto transaction-signing device on which private keys are generated and stored locally and never reach a networked computer, with all data crossing the gap as scanned QR codes.

Technical Skills

Programming: Python, C/C++, Embedded C, MATLAB.

Robotics and Control: ROS 2, sensor fusion, vision-based perception.

Embedded Systems: STM32 platforms, CAN, UART, Modbus.

Machine Learning: PyTorch, TensorFlow, scikit-learn, object detection, tracking, explainable AI.

Design Tools: EAGLE, KiCAD, Autodesk Fusion, Onshape.

Honours and Achievements

- **International Rover Challenge 2024:** 6th globally and 1st in Bangladesh; awarded ABEX Best Science Team.
- **European Rover Challenge 2023:** 16th globally (Project Altair).
- **MATLAB Cody:** Global rank 117, with 914 problems solved and 26 badges.
